Deliverable 1

Initially, we had chosen Sugar Labs as our project of choice. We believed that it was a good choice, and started working to compile the code. After many hours of attempts with no results, we regrouped, and decided to switch to pybliographer. While we could have eventually puzzled out how to get our Sugar Labs activity of choice to compile, we all thought that changing to another project altogether, in the hopes that said project would be simpler to compile, would be a logical decision.

While pybliographer still needed some elbow grease to get it up and running, actually having results at the end of our efforts reconfirmed that our choice had been the right one to make. The necessary code was located on the group's github repository, and we successfully had pybliographer compile and run. From our experience so far, some could say that we gave up on Sugar Labs too early, but from our perspective, switching projects was a good move.
