Deliverable #4

For this deliverable, the goal was get our framework up and running so that it could automatically read through all 25 test cases. We already had a clear idea of how we wanted to go about implementing it, but actually getting everything to function properly took some time. As we were behind for the previous deliverable, we had a lot of ground to catch up, making this particular deliverable even more challenging to complete. We successfully managed to coordinate a meeting that worked for all of us, and got to work.

One of the roadblocks we experienced was figuring out how to go about using absolute paths in python. No one in our group had had any experience with this, so it was a learning experience. As we progressed through the process, minor changes had to be made here and there, but for the most part, the overall design plan remained untouched.

As of right now, our framework is still not quite where it should be; instead of automatically outputting the html file to a web browser, it only creates it. But this is an issue that is not difficult to change between now and the next deliverable. Overall, we managed to accomplish a great deal of work and have progressed very far along with our final project.
